> RE: Hydrogen Energy California Project Application for Certification 08-AFC-8

On behalf of Hydrogen Energy International LLC, the applicant for the abovereferenced Hydrogen Energy California AFC, we are pleased to submit the enclosed document:

- Sixty print copies and seventy-five CDs of the Amendment to the Revised Application for Certification
- · 5 copies of a DVD containing revised Air Quality Modeling Files

The enclosed document is being submitted to the CEC for docketing.

SECTIONONE Introduction

On May 28, 2009, Hydrogen Energy International LLC (HEI) filed a Revised Application for Certification (AFC) with the California Energy Commission (CEC) seeking approval to construct and operate the Hydrogen Energy California Project (HECA or Project) (Docket 08-AFC-8). The Revised AFC was deemed Data Adequate on August 26, 2009.

The Applicant is modifying the Project to eliminate the auxiliary combustion turbine generator (CTG) and demonstrate its emissions of particulates less than 2.5 microns in diameter (PM_{2.5}) will be below the 100 tons per year (tpy) PM_{2.5} Air Quality Standard threshold. This Amendment provides a detailed discussion of the design modification and revisions to the Revised AFC needed to address this change. The elimination of the auxiliary CTG and reduction in emissions rates do not fundamentally alter the nature of the project, nor do they affect the proposed capture and sequestration of Project carbon emissions.

This submittal describes the Amendment and analyzes whether or not the modification results in any environmental consequences not previously analyzed. As demonstrated, the elimination of the auxiliary CTG will not increase the magnitude of any previously identified environmental impacts, or result in any new significant impacts associated with the Project. The emissions of all criteria pollutants and greenhouse gases (GHG) are reduced as a result of this Project modification. Further, the AERMOD and CALPUFF air modeling results demonstrate that the Project modification reduces criteria pollutant and visibility impacts. Therefore, all impacts are expected to remain less than significant with the Project modification.

This Amendment to the Revised AFC presents information that has changed as a result of the Project modification. Tables and figures that have been changed as a result of this modification are included in this Amendment with the original table number, but prefaced with "Revised."

The Project modification consists of eliminating the auxiliary CTG General Electric (GE) LMS100 $^{\$}$ and reducing the emission rates for particulate matter less than 10 microns in diameter (PM₁₀) and particulate matter less than 2.5 microns in diameter (PM_{2.5}) from the GE Frame 7B CTG)/Heat Recovery Steam Generator (HRSG) when firing hydrogen–rich fuel. Therefore, all references in the Revised AFC to the following are no longer applicable: "auxiliary CTG," "peaking power," auxiliary combustion turbine generator," "GE LMS100 $^{\$}$," "CTG-2," "auxiliary Simple Cycle Gas Turbine," "auxiliary Simple Cycle CTG," and "turbines."

The Project would still produce about 250 megawatts (MW) of baseload power and 390 gross MW from the combined cycle plant that is fed by the Gasification Block and would still require two conventional mechanical-draft cooling towers.

The Project modification is within the 473-acre Project Site and does not result in any additional disturbed areas beyond the Site that were not previously evaluated. In addition, the modification is not expected to result in any substantial changes to the schedule, costs, workforce, or traffic during construction or operations, or equipment use during construction, as presented in the Revised AFC.

The Project modification is reflected in the following revised Project Description figures, which are included in this Amendment:

- Revised Figure 2-3: Overall Block Flow Diagram
- Revised Figure 2-5: Preliminary Plot Plan
- Revised Figure 2-6: Project Elevations
- Revised Figure 2-18: Flow Diagram Power Block Systems
- Revised Figure 2-19: Electrical Overall One-Line Diagram (1)
- Revised Figure 2-20: Electrical Overall One-Line Diagram (2)
- Revised Figure 2-22: Electrical Overall One-Line Diagram (4)
- Revised Figure 2-23: Flow Diagram Natural Gas System
- Revised Figure 2-35: Preliminary Hazardous Material Location Plan
- Revised Figure 2-38: Preliminary Emissions Sources Plot Plan
- Revised Figure 2-39: Block Flow Diagram with Air Emission Sources

Changes to the above figures includes removal of equipment shown as Auxiliary CTG Structure and Auxiliary CTG Stack (identified as M2 and 12, respectively, on Figures 2-6 and 2-38) of the Revised AFC.

The following Project Description tables have been revised to reflect the Project modification, and are included in this Amendment:

- Revised Table 2-11: Representative Heat and Material Balances
- Revised Table 2-21: Project Emissions Summary for Normal Operations

Revised Table 2-11 Representative Heat and Material Balances

Notes:

¹ Total annual HRSG emissions represents the maximum emissions rate from a composite firing scenario (all three fuels)

Includes contributions from all three cooling towers

³ Includes contributions from both emergency generators

VOC emissions for fire pump engine are combined with NO_X

⁵ Feedstock emissions are shown as the contribution of all dust collection points

Where $PM_{10} = PM_{2.5}$ it is assumed all PM_{10} is $PM_{2.5}$

CO = carbon monoxide H₂S = hydrogen sulfide

HRSG = heat recovery system generator

 NH_3 = ammonia NO_X = nitrogen oxide

 PM_{10} = particles less than 10 micrometers in diameter $PM_{2.5}$ = particles less than 2.5 micrometers in diameter

 SO_2 = sulfur dioxide

VOC = Volatile Organic Compound

This section discusses potential environmental impacts associated with the Project modification.

3.1 AIR OUALITY

The results of revised Air Quality modeling for Project operations are provided below. Additional data related to Air Quality are presented in the following sections of this Amendment: Section 2, Project Description Change related to changes in projected emissions, and Section 3.6, Public Health regarding toxic air pollutants.

3.1.1 Construction

The Project design modification consists of deleting the auxiliary CTG GE LMS100 $^{\circ}$ and reducing the PM₁₀ and PM_{2.5} emission rates from the GE Frame 7B CTG/HRSG when firing hydrogen–rich fuel. The Project modification is within the 473-acre Project Site and would not result in the disturbance of areas not previously evaluated in the Revised AFC. The Project modification would not increase the expected number or duration, or change the location of construction equipment proposed for the construction of the Project in the Revised AFC. Therefore, the construction emissions calculated and modeled in Section 5.1.2 of the Revised AFC accurately characterize the potential air quality impacts during construction with the Project modification incorporated. The Project modification would not change the conclusions in Section 5.1 of the Revised AFC, and potential air quality impacts during construction are expected to remain less than significant.

3.1.2 Operations

Operational Emissions – Stationary Sources

The Project is a nominal 250 net MW IGCC power generating facility consisting of a Gasification Block and hydrogen-rich fuel production unit with carbon capture capability and a combined-cycle power block. The Gasification Block will feature GE Quench gasifiers and sour shift, and an acid gas removal (AGR) unit to remove sulfur components and recover carbon dioxide. The power block will feature one GE 7FB CTG that can be fueled with hydrogen-rich fuel from the gasification plant, natural gas, or a mixture of the two; a HRSG with duct firing of hydrogen-rich fuel or natural gas; and a condensing steam turbine-generator. The operational emissions from the Project are mainly generated from the combustion of the hydrogen-rich fuel. Other emission sources include cooling towers, solids handling, and an auxiliary boiler.

This Amendment addresses changes to the emission rates from the GE Frame 7B CTG/HRSG as a result of a refinement of the PM_{10} and $PM_{2.5}$ emission factors. The updated emission rates are presented in Revised Table 5.1-20, Total Combined Annual Criteria Pollutant Emissions. There will be no changes to emission rates from other equipment, and therefore they are not discussed in this section.

Power Block CTG/HRSG Operating Emissions

The most significant emission source of the Project will be the CTG/HRSG train. The power block design will be optimized for performance on 100 percent hydrogen-rich fuel, 100 percent natural gas, or co-firing hydrogen-rich fuel and natural gas. Most of the hydrogen-rich fuel from the gasification plant will be used to fully load the CTG, with any excess (up to about 10 to 14 percent) duct fired in the HRSG. The CTG will operate on hydrogen-rich fuel, natural gas, or a mixture of the two (45 to 90 percent hydrogen-rich fuel) over the compliance load range of 60 to 100 percent. The CTG may be co-fired with natural gas as required to maintain emission-compliant operation if the quantity of hydrogen-rich fuel is insufficient or hydrogen-rich fuel is completely unavailable.

Maximum short-term operational emissions from the CTG/HRSG were determined from a comparative evaluation of potential emissions corresponding to normal operating conditions (including HRSG duct-firing), and CTG startup/shutdown conditions. The long-term operational emissions from the CTG/HRSG were estimated by summing the emissions contributions from normal operating conditions (including hours with and without duct-firing) and CTG/HRSG startup/shutdown conditions. Estimated annual emissions of air pollutants for the CTG/HRSG have been calculated based on the expected operating schedule for the CTG/HRSG presented in Table 5.1-11, Maximum CTG/HRSG Operating Schedule in the Revised AFC (which remains unchanged in this Amendment).

Operational emissions from the CTG/HRSG were estimated for all the applicable scenarios using base emission rates and startup/shutdown emissions. The base criteria pollutant emission rates provided by the turbine vendor and the engineer for three load conditions (60, 80, and 100 percent) and three ambient temperatures (20, 65, and 97 degrees Fahrenheit [°F]) when firing natural gas, hydrogen-rich fuel, or cofiring are presented in Revised Table 5.1-12, 1-Hour Operating Emission Rates for CTG/HRSG Operating Load Scenarios. There will be a revision to the PM_{10} and $PM_{2.5}$ emissions rates from the CTG/HRSG when firing hydrogen-rich fuel due to a refinement of the PM_{10} and $PM_{2.5}$ emission factor. The changes to PM_{10} and $PM_{2.5}$ emission rates are presented in Revised Table 5.1-12.

CTG/HRSG Startup and Shutdown Emissions

The expected emissions and durations associated with CTG/HRSG startup and shutdown events are summarized in Revised Table 5.1-13, CTG/HRSG Criteria Pollutant Emission Rates During Startup and Shutdown. No changes to the startup and shutdown times result from this Amendment. However, there will be a revision to the PM_{10} and $PM_{2.5}$ emission rates during cold startup and hot startup scenarios due to a refinement of the PM_{10} and $PM_{2.5}$ emission factor.

CTG/HRSG Emissions Scenarios for Modeling

Reasonable worst-case short-term emissions from the turbines were calculated for use in the air quality modeling. These scenarios form the basis for the air dispersion modeling analyses presented in Section 3.1.3, Dispersion Modeling.

Revised Table 5.1-14, Criteria Pollutant Sources and Emission Totals for the Worst-Case CTG Emissions Scenario for All Averaging Times, summarizes the worst-case emissions scenarios adopted to assess maximum impacts to air quality and air quality-related values in the modeling analyses presented in Section 3.1.3.

Estimated annual emission totals for all pollutants incorporate the maximum anticipated emissions related to startups and shutdowns, as well as the maximum steady-state operating emissions with and without duct firing. Estimated maximum annual emissions for the GE 7FB turbine are presented in Revised Table 5.1-15, Average Annual Emissions per Turbine Operating Scenario. Emissions calculations for all scenarios, including revisions, are contained in Revised Appendix D1.2.

Source: HECA Project

Notes:

CTGs will always be started burning natural gas. Startup and shutdown emission rates above reflect natural gas.

Startup and shutdown SO_2 emissions will always be lower than normal operation SO_2 emissions. Startup and shutdown emissions are assumed equal to normal operations (burning natural gas) at the max emission rate.

Startup/shutdown duration defined as operation of CTG below 60 percent load when gaseous emission rates (lb/hr basis) exceed the controlled rates defined as normal operation

CO = carbon monoxide NO_X = nitrogen oxides

 PM_{10} = particulate matter less than 10 microns in diameter and is assumed to equal $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter

 SO_2 = sulfur dioxide

VOC = volatile organic compounds

Revised Table 5.1-14 Criteria Pollutant Sources and Emission Totals for the Worst-Case CTG Emissions Scenario for All Averaging Time

			Emissions in Pounds – Entire Period

Commissioning

In this Amendment, there will be no emission rates associated with the commissioning of the Auxiliary CTG, because this unit will no longer be part of the Project design.

PM₁₀ emission rates are expected to be lower when commissioning the CTG/HRSG on hydrogen-rich fuel. However, no changes will be made to the emission rates represented in Table 5.1-22 of the Revised AFC, Duration and Criteria Pollutant Emissions for Commissioning of the CTG/HRSG on Hydrogen-Rich Fuel at 59°F. Therefore, PM₁₀ emission rates during the commissioning of the CTG/HRSG on hydrogen-rich fuel will be a conservative over-estimate.

Greenhouse Gas Emissions

The revised table included in Revised Appendix D1.2 presents the peak or maximum possible carbon dioxide emissions for all Project emission sources. In this Amendment, the total plant GHG emissions will be 185,117 tons per year. The decrease in GHG emissions is due to the removal of the Auxiliary CTG unit, which will decrease GHG emissions by 198,200 tons per year.

The Project's greenhouse gas emissions will continue to be well below the 1,100 lbs/MWh threshold requirement (natural gas combined cycle comparison) of Senate Bill 1368.

Operational Emissions – Mobile Sources

There will be no changes to the mobile source operational emissions as a result of this Amendment.

3.1.3 Dispersion Modeling

The purpose of the air quality impact analyses is to evaluate whether criteria pollutant emissions resulting from the Project will cause or contribute significantly to a violation of a California or national Ambient Air Quality Standards (AAQS) or contribute significantly to degradation of air quality-related values in Class I areas. The air quality impact analyses were performed using the same model and model option selections, and receptor locations as in the Revised AFC. Copies of the revised modeling files are included on the Revised Air Quality Modeling DVD included with this Amendment.

Building Wake Effects

The BPIP-Prime analysis was rerun to take into account the removal of the Auxiliary CTG structure. An updated table listing all the structures, minus the Auxiliary CTG building, evaluated in the downwash analysis is included in Revised Appendix C3.

Input and output electronic files for the BPIP-Prime analysis are included with those from all other dispersion modeling analyses on the Revised Air Quality Modeling DVD included with this Amendment.

Meteorological Data

The original meteorological data set issued by San Joaquin Valley Air Pollution Control District (SJVAPCD) was used in this modeling analysis.

Construction Impacts Modeling

There will be no change to the construction impacts modeling results in this Amendment.

Turbine Impact Screening Modeling

The Revised AFC described a turbine impact screening modeling analysis that was performed to determine which CTG/HRSG operating mode and stack parameters produced worst-case off-site impacts (i.e., maximum ground level concentrations for each pollutant and averaging time). Only the emissions from the CTGs with and without duct firing and evaporative cooling were considered in this preliminary modeling step. The AERMOD model simulated transport and dispersion of natural gas combustion emissions released from the 20-foot-diameter (6.10-meter), 213-foot-tall (65-meter) stack for the CTG/HRSG unit. Unlike the Revised AFC, the AERMOD model was not used to simulate emissions for the Auxiliary CTG, since it has been removed from the Project design. Revised Table 5.1-32, Turbine Screening Results Normal Operations – Emissions and Stack Parameters per Turbine, summarizes the combustion CTG screening results for the different CTG operating load conditions.

The maximum ground level concentrations predicted to occur off site with unit turbine emission rates for each of the seven operating conditions shown in Revised Table 5.1-32 were then multiplied by the corresponding turbine emission rates for specific pollutants. The highest resulting concentration values for each pollutant and averaging time were then identified (see bolded values in the table).

The stack parameters associated with these maximum predicted impacts were used in all subsequent simulations of the refined AERMOD analyses described in the next subsection. (Note that the lower exhaust temperatures and flow rates at reduced turbine loads correspond to reduced plume rise, in some cases resulting in higher off-site pollutant concentrations than the higher baseload emissions.) Model input and output files for the screening modeling analysis are included with those from all other modeling tasks on the Revised Air Quality modeling DVD that is provided with this Amendment.

Notes:

Notes:

CO = carbon monoxide

 $\begin{array}{lll} CTG & = & combustion turbine generator \\ \mu g/m^3 & = & micrograms per cubic meter \\ {}^{\circ}F & = & degrees Fahrenheit \\ g/s & = & grams per second \end{array}$

HRSG = heat-recovery steam generator

K = Kelvin $NO_2 = nitrogen$

 NO_2 = nitrogen dioxide NO_X = nitrogen oxides

 PM_{10} = particulate matter less than 10 microns in diameter

SCR = selective catalytic reduction

 SO_2 = sulfur dioxide

Only 1-hour impacts were modeled. Impact concentrations for other averaging times were estimated with USEPA Screening Factors: 0.9 for a 3-hour average time, 0.7 for an 8-hour average time, 0.4 for a 24-hour average time, and 0.08 for an annual average.

1-Hour Startup Scenarios

The worst-case 1-hour NO_2 and CO impacts will occur during an hour with a startup; thus, the results of the screening analysis were not used to determine the turbine stack parameters. The results in Revised Table 5.1-32 indicate that maximum hourly NO_2 and CO concentrations during normal operations will occur with the stack parameters corresponding to 60 percent load. However, the magnitude of the emissions for both these pollutants during the worst-case 60 minutes of the turbine startup sequence will be higher than those during normal operations at any ambient temperature condition. Because a startup is a transition from non-operation to full-load operation, the stack exhaust velocity and temperature during most of this operation are lower than the values indicated as "worst-case" by the turbine screening modeling. Accordingly, modeling simulations were conducted to estimate the maximum 1-hour NO_2 and CO concentrations during a startup with reduced stack exhaust velocity and temperature.

Refined Modeling

A refined modeling analysis was performed to estimate off-site criteria pollutant impacts from operational emissions of the Project. The CTG/HRSG was modeled assuming the worst-case emissions corresponding to each averaging time and the turbine stack parameters that were determined in the turbine screening analysis (see previous subsection). The maximum mass emission rates that will occur over any averaging time, whether during turbine startups, normal operations, turbine shutdowns, or a combination of these activities, were used in all refined modeling analyses (see Revised Table 5.1-32).

The DEGADIS model that was used to calculate CO and H₂S impacts from the carbon dioxide vent in the Revised AFC was not re-run, because there were no changes made to the emission rates from the carbon dioxide vent in this Amendment.

Fumigation Analysis

Fumigation modeling was conducted in the same manner as described in the Revised AFC. However, because the Auxiliary CTG stack is no longer a part of the Project, SCREEN3 was run for the CTG/HRSG unit, tail gas thermal oxidizer, and gasifier refractory heater stack parameters. In addition, new PM₁₀ and PM_{2.5} pollutant emissions were used in the fumigation analysis for the CTG/HRSG unit.

A unit emission rate was used (1 gram per second) in the fumigation modeling to obtain a maximum unit concentration (x/Q), and the model results were scaled to reflect expected Project emissions for each pollutant. Inversion breakup fumigation concentrations were calculated for 1- and 3-hour averaging times using U.S. Environmental Protection Agency (USEPA)—approved conversion factors. These multiple-hour model predictions are conservative, since inversion breakup fumigation is a transitory condition that would most likely affect a given receptor location for only a few minutes at a time. To calculate the inversion breakup fumigation, the default thermal internal boundary layer (TIBL) factor of 6 in the SCREEN3 model was used.

Fumigation impacts can affect concentrations longer than 1 hour; the procedures described in Section 4.5.3 of "Screening Procedures for Estimating the Air Quality Impact of Stationary Sources" (USEPA, 1992) were used to determine the 3- and 8-hour average concentrations.

Modeling input and output files are included on the Revised Air Quality Modeling DVD included with this Amendment.

3.1.4 Compliance with Ambient Air Quality Standards

Air dispersion modeling was performed according to the methodology described in Section 3.1.3, Dispersion Modeling. This was done to evaluate the maximum increase in ground level pollutant

concentrations resulting from Project emissions based on the modifications, and to compare the maximum predicted impacts, including background pollutant levels, with applicable short-term and long-term California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS).

Construction Impacts

There will be no change to the construction impacts in this Amendment.

Operations Impacts

The emissions used for each pollutant and averaging time are explained and quantified in Section 3.1.2, Operations. Commissioning impacts, which will occur on a temporary, one-time basis and will not be representative of normal operations, were addressed separately, as described in the next section.

Revised Table 5.1-35, AERMOD Modeling Results for Project Operations (All Project Sources Combined), summarizes the maximum predicted criteria pollutant concentrations due to Project emissions. The incremental impacts of Project emissions will be below the federal Prevention of Significant Deterioration (PSD) Significant Impact Levels (SILs) for all attainment pollutants, despite the use of worst-case emissions scenarios for all pollutants and averaging times. Although maximum predicted values for PM_{10} are below the SILs, these thresholds do not apply to this pollutant because the San Joaquin Valley Air Basin is designated as being in non-attainment with respect to the federal ambient standards. No SILs have been established yet for $PM_{2.5}$.

Revised Table 5.1-35 also shows that the modeled impacts due to the Project emissions, in combination with conservative background concentrations, will not cause a violation of any NAAQS and will not significantly contribute to the existing violations of the federal and state PM_{10} and $PM_{2.5}$ standards. In addition, as described later, all of the Project's operational emissions of non-attainment pollutants and their precursors will be offset to ensure a net air quality benefit.

The locations of predicted maximum impacts will vary by pollutant and averaging time. Revised Figure 5.1-3, Locations of Maximum Predicted Ground Level Pollutant Concentrations for the Operational Project Area, shows the locations of the maximum predicted operational impacts for all pollutants and averaging times.

The peak 24-hour PM_{10} , $PM_{2.5}$, and SO_2 concentrations and peak SO_2 annual concentration are predicted to occur on the western boundary of the Project Site, while the peak annual PM_{10} and $PM_{2.5}$ concentrations are predicted to occur on the eastern boundary of the Project Site. The peak 1-hour NO_X , SO_2 , and CO concentrations, peak 3-hour SO_2 concentration, and peak 8-hour CO concentration are predicted to occur within approximately 2 miles south of the Project Site. The peak annual NO_X concentration occurred at the northern property boundary.

Carbon monoxide impacts from the carbon dioxide vent were predicted to be 2,934 micrograms per cubic meter ($\mu g/m^3$) at a point off of the Project Site and Controlled Areas at 778 meters from the source. This value is below the CAAQS for CO and below the 8-hour CO SIL, but above the 1-hour CO SIL. A stability class of D combined with a wind speed of 1 meter per second was found to calculate the worst-case results.

Hydrogen sulfide impacts from the carbon dioxide vent were predicted to be $35.84 \,\mu g/m^3$ at the maximum impact point off of the Project Site and Controlled Areas at 778 meters from the source. This value is below the 1-hour CAAQS of $42 \,\mu g/m^3$.

Fumigation

The predicted peak concentrations from inversion fumigation from Project emissions, including background, are predicted to be below the CAAQS and are as follows:

 NO_X 1-hour = 269.25 μ g/m³ SO_2 1-hour = 32.68 μ g/m³ SO_2 3-hour = 21.60 μ g/m³ CO 1-hour = 5,228.26 μ g/m³

Turbine Commissioning

As mentioned in Section 3.1.2, Operations, changes will be made to the commissioning emission rates, even though the emission rates in the Revised AFC would overestimate emission rates due to the removal of the Auxiliary CTG. The AERMOD model will not be re-run, since there were no changes to turbine commissioning emission rates.

Impacts for Non-Attainment Pollutants and their Precursors

The emission offset program described in the SJVAPCD Rules and Regulations was developed to facilitate net air quality improvement when new sources locate within the District. Project impacts of non-attainment pollutants (PM₁₀, PM_{2.5}, and O₃) and their precursors (NO_X, SO₂, and VOC) will be fully mitigated by emission offsets. The emission reductions associated with these offsets have not been accounted for in the modeled impacts noted above. Thus, the impacts indicated in the foregoing presentation of model results for the Project may be significantly overestimated.

Effects on Visibility from Plumes

There will be no changes to the effects on visibility from plumes, since there are no changes to the cooling tower emissions in this Amendment.

3.1.5 Impacts on Air Quality Related Value in Class I Areas

The CALPUFF modeling analysis for impacts to Air Quality Related Values (AQRV) was updated to reflect the project design changes. The objectives of the modeling were to demonstrate whether air emissions from the Project will cause or contribute to a PSD increment exceedance or cause a significant impact on visibility, regional haze, or sulfur or nitrogen deposition in any Class I area.

Since the Project location has not changed in this Amendment, the same Class I area (San Rafael Wilderness Area) was included in the revised AQRV analysis. PSD increment analysis for the San Rafael Wilderness Class I area is shown in Revised Table 5.1-37, PSD Class I Increment Significance Analysis – CALPUFF Results. No Class I PSD increments will be exceeded.

CAAQS = California Ambient Air Quality Standards

CO = carbon monoxide H₂S = hydrogen sulfide

 $\mu g/m^3$ = micrograms per cubic meter

NAAQS = National Ambient Air Quality Standards

NO₂ = nitrogen dioxide OLM = ozone limiting method

PM₁₀ = particulate matter less than 10 microns in diameter PM_{2.5} = particulate matter less than 2.5 microns in diameter

 SO_2 = sulfur dioxide

¹ Ozone Limiting Method (OLM) was applied using hourly O₃ data.

² CO₂ Vent was not included in the AERMOD analysis; it was modeled using DEGADIS/SCREEN3, which predicted maximum impacts of 2,934 μg/m³ for the 1-hour average. The current assumption is that only one gasifier heater is expected to be operational at any time. Auxiliary Boiler does not operate with HRSG at the same time for short-term average period. Therefore, the Auxiliary Boiler was not included in the modeling analysis while HRSG was included because HRSG gives more impact on off-Project Site and Controlled Area concentration.

³ For short-term (1-, 3-, 8-, and 24-hour) modeling, only one emergency generator will be operational at any one time, and the current assumption is that only one gasifier heater is expected to be operational at any one time.

⁴ Monitoring station for the maximum background concentration is described below:

⁵ H₂S was modeled using DEGADIS (its only source is the CO₂ vent). DEGADIS is a screening model that uses worst-case meteorology rather than actual monitored hourly meteorological data.

Revised Table 5.1-37
PSD Class I Increment Significance Analysis – CALPUFF Results

Class I Area	Pollutant Unit Threshold	Annual NO _x μg/m ³ 0.1	3-hour SO ₂ µg/m ³	24-hour SO ₂ µg/m ³ 0.2	Annual SO ₂ µg/m ³ 0.08	24-hour PM ₁₀ µg/m ³ 0.32	Annual PM ₁₀ Annual 0.16

 $\mu g/m^3$ = micrograms per cubic meter

 NO_X = nitrogen oxides

 PM_{10} = particulate matter less than 10 microns in diameter

 SO_2 = sulfur dioxide

Effects on Visibility. This revised analysis was conducted using the same model (CALPUFF). The same 3-year meteorological data set for 2001-2003 was used in the revised analysis.

Visibility impact results for the San Rafael Wilderness Class I area are shown in Revised Table 5.1-38, Visibility Analysis – CALPUFF Results. No maximum extinction change exceeds 10 percent with only 1 to 3 days of exceedance of 5 percent despite the conservative operating scenario. Therefore, the Project screening successfully passed all screening criteria.

Revised Table 5.1-38
Visibility Analysis – CALPUFF Results

Class I Area	Pollutant Unit Threshold	No. of Days > 5% Days 0	No. of Days >10% Days 0	Maximum Extinction Change % 10	Day of Maximum Extinction Change Julian Day

Terrestrial Resources. This revised analysis was conducted using the same model (CALPUFF). Revised Table 5.1-39, Total Nitrogen and Sulfur Deposition Analysis – CALPUFF Results, summarizes the maximum modeled impacts versus the National Park Service and the U.S. Forest Service significance criteria. All impacts are below the significance criteria.

Revised Table 5.1-39
Total Nitrogen and Sulfur Deposition Analysis – CALPUFF Results

Class I Area	Pollutant Unit Threshold	Deposition Nitrogen g/m²/s 1.59E-11	Deposition Sulfur g/m²/s 1.59E-11

Notes:

 $g/m^2/s$ = grams per square meter per second.

Aquatic Resources. A significant effect of NO_X and SO_2 emissions on aquatic resources is nitrogen and sulfur deposition and subsequent acidification. However, because any increased nitrogen and sulfur deposition due to the Project will be minimal, impacts to water acid neutralizing capacity and pH, and, therefore, acidification or eutrophication, are not likely to occur.

The revised CALPUFF/CALMET air impact modeling analysis for Class I areas is presented in selected revised tables, provided in Revised Portions of Appendix C4.

3.1.6 Cumulative Impacts Analyses

CEC requirements specify that an analysis may be required to determine the cumulative impacts of the Project and other Projects within a 6-mile radius that have received construction permits but are not yet operational or that are in the permitting process. The cumulative impact analysis is intended to assess whether the emissions of the combined effects of these sources may cause or contribute to a violation of any AAQS.

The Applicant has obtained a list of projects within a 6-mile radius from the Project from the SJVAPCD. (See Appendix J, List of Proposed Projects of the Revised AFC.) These projects are generally of the type that are small with respect to air quality impacts from operation but will be re-analyzed in a cumulative impact analysis if requested by the CEC staff. The emissions inventory from this Amendment will be used in the cumulative impact analysis. The results of the final cumulative impact analysis will be reported under separate cover.

3.1.7 Mitigation Measures

Revised estimated required emission reduction credits due to the Project modification are presented in selection revised tables provided in Revised Portions of Appendix T.

3.2 BIOLOGICAL RESOURCES

3.2.1 Construction

The Project modification is within the 473-acre Project Site and would not result in disturbance of areas that were not previously evaluated in the Revised AFC. Therefore, the modification would not change the analysis of potential impacts to biological resources described in Section 5.2 of the Revised AFC for construction, and impacts to biological resources during construction are expected to remain less than significant with implementation of the mitigation measures identified in Section 5.2.4 of the Revised AFC.

3.2.2 Operations

The Project modification consists of eliminating the auxiliary CTG, which would result in a decrease of air emissions. Section 5.2 of the Revised AFC concluded that the emissions associated with this Project would not result in significant impacts to the plants and animals found in the region. Therefore, the modification would not change the analysis of potential impacts to biological resources described in Section 5.2 of the Revised AFC for operations, and impacts to biological resources during operations are expected to remain less than significant.

3.3 CULTURAL RESOURCES

The Project modification is within the 473-acre Project Site and would not result in disturbance of areas not previously evaluated in the Revised AFC. Therefore, the modification would not change the analysis of potential impacts to cultural resources described in Revised AFC Section 5.3 for construction or operations, and impacts to cultural resources are expected to remain less than significant with implementation of the mitigation measures identified in Revised AFC Section 5.3.4.

3.4 LAND USE AND AGRICULTURE

3.4.1 Construction

The Project modification consists of eliminating the auxiliary CTG within the 473-acre Project Site and would not result in disturbance of areas not previously evaluated in the Revised AFC or affect distances to nearby sensitive land uses. Therefore, the modification would not change the analysis of potential impacts to land use described in Section 5.4 of the Revised AFC for construction, and impacts to land use and agriculture during construction are expected to remain less than significant.

3.4.2 Operations

The elimination of the auxiliary CTG from the Project is within the 473-acre Project Site and would not result in disturbance of areas not previously evaluated in the Revised AFC or affect distances to nearby sensitive land uses. The Project modification would not alter the analysis of potential impacts to land use and agriculture as presented in Section 5.4 of the Revised AFC for operations, which found that the Project would not disrupt or divide an established community; would not conflict with the established uses of the area; would be consistent with existing zoning and applicable land use plans, policies, and regulations; and would have less-than-significant impacts on farmlands. Therefore, as described in Section 5.4 of the Revised AFC, potential impacts to land use and agricultural resources during operations are expected to remain less than significant.

3.5 NOISE

3.5.1 Construction

The Project modification consists of eliminating the auxiliary CTG and would not result in disturbance of areas not previously evaluated in the Revised AFC or affect distances to the nearest sensitive noise receptors. The design modification is not expected to significantly affect the Project's construction equipment use, construction hours, or construction traffic, and would not result in significant changes to potential noise emissions during construction that were modeled and presented in Sections 5.5.2.1 and 5.5.2.6 of the Revised AFC. Therefore, the modification would not change the analysis presented in Section 5.5 of the Revised AFC for construction, and impacts from noise during construction are expected

to be less than significant with implementation of the mitigation measure presented in Section 5.5.4 of the Revised AFC.

3.5.2 Operations

The auxiliary CTG was originally excluded from the noise analysis for nighttime operations since it has was not anticipated to operate at night. Consequently, its elimination from the Project would not change the original nighttime impact assessment presented in Section 5.5 of the Revised AFC. Specifically, the discussions under the heading "Noise Analysis Compared to CEC Significance Thresholds" as well as Table 5.5-19 of the Revised AFC do not change with this Amendment.

Since the auxiliary CTG was originally modeled for the daytime operations scenario, its removal as part of this Amendment would eliminate one of the modeled noise sources and would thus reduce the daytime plant contributions as presented in Revised Tables 5.5-17 and 5.5-18 (impact assessment relative to Kern County Noise Element Standards). These aggregate plant contributions would be reduced by 1 to 2 decibels (dB), as compared to the information presented in the Revised AFC. Revised Tables 5.5-17 and 5.5-18 are provided below.

Revised Table 5.5-17 Summary of Project Contributions with Noise Control Features Relative to Kern County Noise Element Standards (Exterior)

Location [column 1]	Kern County Noise Element Exterior Standards, L _{dn} [column 2]	Existing Exterior L _{dn} Environ- ment [column 3]	Predicted Project L _{eq} Contributions, dBA [column 4]	Predicted Project L_{dn} Contributions, [column 5] a	Total, Future Calculated L_{dn} (existing plus Project) $[column \ 6]^b$	Project Contribution/ Project Compliance ^{c,f} [column 7]
LT1/ST1	65	58	37	43	58	0 / Yes
LT2/ST2	65	61	37	43	61	0 / Yes
LT3/ST3	65	70	24	30	70	0 / Yes
ST4	65	51 ^e	33	39	51	0 / Yes
ST5	65	68 ^e	36	42	68	0 / Yes

Source: HECA Project

Notes:

- a Using 24 hourly Leq values to calculate the equivalent Ldn metric, assuming continuous operations at steady-state, design conditions. Thus, $L_{dn} = L_{eq} + 6 \ dB$.
- b Summing sound levels from column 3 plus column 5.
- c Is column 6 less than or equal to columns 3 and 2?
- d Footnote not used.
- e Estimated Ldn from short-term data in Tables 5.5-8 and 5.5-9.
- f Result is completely controlled by the existing noise environment.

It should be noted that the last column of both of these revised tables show that the plant contribution to the future environment remains at 0 dB and that, as a result, all locations are in compliance. From an analytical standpoint, removing the LMS100[®] would reinforce that the Revised AFC-stated 0 dB Project contribution would be even lower than the existing conditions (which are due to other sources).

In summary, the deletion of the auxiliary CTG would not change the previous conclusions in Section 5.5 of the Revised AFC, but would add a factor of conservatism to the daytime operations scenario presented in the Revised AFC. Since the conclusions for compliance at all locations for the daytime noise scenarios would only change in a beneficial direction by the deletion of this noise source and would remain unchanged for nighttime operations, noise impacts during operations would remain less than significant.

Revised Table 5.5-18 Summary of Project Contributions with Noise Control Features Relative to Kern County Noise Element Standards (Interior)

Location [column 1]	Kern County Noise Element Interior Standards, L _{dn} [column 2]	Existing Interior L _{dn} Environ- ment ^a [column 3]	Predicted Project Exterior L _{dn} Contributions, [column 4] b	Predicted Project Interior L _{dn} Contributions, [column 5] c	Total, Future Calculated L _{dn} (Existing plus Project) ^f [column 6] ^d	Project Contribution/ Project Compliance ^{ef} [column 7]
LT1/ST1	45	41	43	26	41	0 / Yes
LT2/ST2	45	44	43	26	44	0 / Yes
LT3/ST3	45	53	30	13	53	0 / Yes
ST4	45	34	39	22	34	0 / Yes
ST5	45	51	42	25	51	0 / Yes

Source: HECA Project

Notes

- a Applying -17 dB to results from Table 5.5-16 above.
- b Using results of column 5 from Table 5.5-16 above.
- c Applying -17 dB to column 4.

- d Summing sound levels from column 3 plus column 5.
- e Is column 6 less than or equal to columns 3 and 2?
- f Result is completely controlled by the existing noise environment.

3.6 PUBLIC HEALTH

3.6.1 Construction

The Project modification consists of deleting the auxiliary CTG GE LMS100 $^{\circ}$ and reducing the PM₁₀ and PM_{2.5} emission rates from the GE Frame 7B CTG/HRSG when firing hydrogen–rich fuel. This modification is within the 473-acre Project Site and would not result in disturbance of areas not previously evaluated in the Revised AFC. The Project modification would not change the analysis presented in Section 5.6 of the Revised AFC, and public health impacts during construction are expected to remain less than significant.

3.6.2 Operations

The Project modification would not increase emissions of toxic air contaminants during operation. Therefore, the modification would not change the analysis presented in Section 5.6 of the Revised AFC, which concluded that the impact of the Project's emissions of toxic air contaminants during operation would be less than significant. Therefore, public health impacts during operation are expected to remain less than significant.

3.7 WORKER SAFFTY AND HEALTH

The design modification consists of eliminating the auxiliary CTG and would not change the anticipated workplace hazards or require changes to the safety programs presented in Section 5.7 of the Revised AFC. Therefore, impacts to worker safety and health during construction and operation are expected to remain less than significant.

3.8 SOCIOECONOMICS/ENVIRONMENTAL JUSTICE

The Project modification consists of eliminating of the auxiliary CTG. The modification is not expected to substantially affect the Project's costs or workforce for construction or operations. Therefore, the design modification would not change the analysis presented in Section 5.8 of the Revised AFC, which concluded that the Project would not induce substantial growth or concentration of population; induce substantial increases in demand for public service and utilities; disrupt or divide an established community; or result in disproportionate adverse effects on minority or low-income populations. Economic benefits previously identified related to payroll, purchasing, and tax revenues would be marginally less than identified in the Revised AFC. However, these reductions are not expected to change the conclusions in Section 5.8 of the Revised AFC. Therefore, marginal socioeconomic impacts during construction and operations are expected to remain less than significant.

3.9 SOILS

The Project modification consists of eliminating the auxiliary CTG within the 473-acre Project Site and does not result in disturbance of areas not previously evaluated in the Revised AFC. The elimination of the auxiliary CTG would not result in increased soil erosion or loss of topsoil beyond that evaluated in the Revised AFC, and the area on which the auxiliary CTG would have been located is within the footprint of ground disturbance previously evaluated. The area would still be managed to prevent soil erosion with implementation of mitigation measures identified in Section 5.9.4 of the Revised AFC. Therefore, the modification would not change the analysis presented in Section 5.9 of the Revised AFC, and impacts are expected to be less than significant with implementation of the mitigation measure presented in Section 5.9.4 of the Revised AFC.

3.10 TRAFFIC AND TRANSPORTATION

3.10.1 Construction

The elimination of the auxiliary CTG is not expected to substantially affect the traffic or workforce associated with construction of the Project. The Project would continue to experience short-term increases in traffic associated primarily with construction worker commute and material and equipment delivery trips. No increases to the number of construction workers or projections for construction equipment and material deliveries (including soil fill deliveries) would occur as a result of the Project modification. Therefore, the design modification would not change the analysis presented in Section 5.10 of the Revised AFC, which concluded that potential traffic and transportation impacts are expected to remain less than significant with implementation of the construction mitigation measures presented in Section 5.10.4.1 of the Revised AFC.

3.10.2 Operations

The elimination of the auxiliary CTG would not affect the traffic or workforce associated with operation of the Project. The Project would continue to experience increases in traffic associated with worker commute, feedstock deliveries, and operation and maintenance (O&M) trips. No increases in the number of operations personnel or the projected deliveries and O&M trips would occur as a result of the Project modification. Therefore, the design modification would not change the analysis presented in Section 5.10 of the Revised AFC, which concluded that potential traffic and transportation impacts are expected to remain less than significant with implementation of the operations mitigation measures presented in Section 5.10.4.2 of the Revised AFC.

URS

With elimination of the auxiliary CTG, it is currently estimated that the construction cost may be reduced by 3 to 4 percent, and the operation cost may be reduced by 1 to 2 percent.

3.11 VISUAL RESOURCES

The Project modification consists of eliminating the auxiliary CTG within the 473-acre Project Site and would not result in the disturbance of areas not previously evaluated in the Revised AFC. Revised Figure 2-6 provides new elevation drawings incorporating the Project modification. This figure has been revised to delete the following equipment from the previous drawings: Auxiliary CTG Structure (previously identified as No. M2, with height of 45 feet) and the Auxiliary CTG Stack (previously identified as No. 12, with height of 110 feet).

Due to the comparatively small scale of the auxiliary CTG, it was not a prominent feature in any of the visual simulations and its removal from the Project design would serve to have minimal decreases in the Project's overall visibility from the Key Observation Points. The Project modification would not change any of the conclusions in Section 5.11 of the Revised AFC, and potential visual impacts are expected to remain less than significant with implementation of the mitigation measures presented in Section 5.11.4 of the Revised AFC.

3.12 HAZARDOUS MATERIALS

3.12.1 Construction

The elimination of the auxiliary CTG from the Project would not result in increases to the hazardous materials that would be used during construction of the Project. The elimination of the auxiliary CTG would result in a minor reduction to the total quantity of hazardous materials that would be used during the construction phase of the Project, as assembly of the LMS100[®] auxiliary CTG would no longer be required. As described in Section 5.12 of the Revised AFC, potential hazardous materials handling impacts are expected to remain less than significant with implementation of the construction mitigation measures presented in Section 5.12.5.1 of the Revised AFC.

3.12.2 Operations

The elimination of the auxiliary CTG from the Project would not result in increases to the hazardous materials that would be used during operation of the Project. Materials that would have been used for the auxiliary CTG (such as natural gas, lubricating oil, nitrogen, and ammonia) would continue to be present at the Project site for use with the combined cycle CTG, as specified in the Revised AFC. The slight decrease in hazardous materials to be used during operations would not impact the scenarios or conclusions of the offsite consequence analysis presented in Section 5.12 of the Revised AFC (Hazardous Materials Handling), nor the scenarios and conclusions presented in Appendix L of the Revised AFC (Hazardous Materials Technical Analysis). In addition, the reduction in wastes generated from the operation of the auxiliary CTG (such as used oil) would not substantially affect or change Section 5.12 of the Revised AFC.

Revised Figure 2-35, Preliminary Hazardous Material Location Plan, is included in this Revised AFC Amendment. The only change in this figure is the deletion of the auxiliary CTG. The hazardous material locations are unchanged from the original figure.

As described in Section 5.12 of the Revised AFC, potential hazardous materials handling impacts are expected to remain less than significant with implementation of the operations mitigation measures presented in Section 5.12.5.2 of the Revised AFC.

3.13 WASTE MANAGEMENT

3.13.1 Construction

The Project modification consists of eliminating the auxiliary CTG. The modification would result in a minor reduction of the quantities hazardous wastes, non-hazardous wastes and wastewater associated with construction of the Project, as assembly of the auxiliary CTG would no longer occur. The design modification would not affect the best management practices described in Section 5.13 of the Revised AFC that would be implemented during construction of the Project to manage and minimize the amount of waste generated, nor would it change the conclusions in Section 5.13 of the Revised AFC. Therefore, the potential construction-related waste management impacts identified in Section 5.13 of the Revised AFC are expected to remain less than significant with implementation of mitigation measures described in Section 5.13.4.1 of the Revised AFC.

3.13.2 Operations

The elimination of the auxiliary CTG would not result in increases to the amount of wastes generated during operation of the Project. Operation waste streams would remain as described in Section 5.13 of the Revised AFC, and the slight decrease in wastes generated during operations would not impact the conclusions presented in Section 5.13 of the Revised AFC. In addition, the slight reduction in wastes generated from the operation of the auxiliary CTG (such as used oil) would not substantially affect impact or change the assumptions and conclusions in Section 5.13 of the Revised AFC. Therefore, the operations-related waste management impacts identified in Section 5.13 of the Revised AFC are expected to remain less than significant with implementation of mitigation measures described in Section 5.13.4.2 of the Revised AFC.

3.14 WATER RESOURCES

3.14.1 Construction

The Project modification consists of eliminating the auxiliary CTG. This modification would not affect the Project water needs during construction, since two conventional mechanical-draft cooling towers would still be constructed, and the project water supply plan would remain as described in Section 5.14 of the Revised AFC. Construction of the Project would not result in changes to the analysis of groundwater, surface water, or flood hazards, as presented in Section 5.14 of the Revised AFC. Therefore, impacts to water resources are expected to remain less than significant with implementation of the mitigation measures presented in Section 5.14.4 of the Revised AFC.

3.14.2 Operation

The elimination of the auxiliary CTG would not affect water resources during Project operations. The Project would not have any negative effect on the quality of groundwater in the area, and would continue to have a net positive effect on groundwater quality and agricultural activity. The Project modification is not anticipated to affect surface waters during operations. Therefore, the modification would not change the analysis presented in Section 5.14 of the Revised AFC, and impacts are expected to be less than significant with implementation of mitigation measures presented in Section 5.14.4 of the Revised AFC.

3.15 GEOLOGIC HAZARDS AND RESOURCES

The Project modification consists of eliminating the auxiliary CTG and does not result in disturbance of areas that were not previously evaluated in the Revised AFC. This modification would not result in increased impacts to geologic or mineral resources during construction or operation, and the analysis

presented in Section 5.15 of the Revised AFC would not change. Construction-related impacts to geologic or mineral resources would continue to primarily involve grading operations and operations for foundation support. During operation, potential impacts of geologic hazards on the Project and ancillary facility operations would still include seismic shaking. Therefore, as described in Section 5.15 of the Revised AFC, impacts to geologic hazards and resources are expected to remain less than significant with implementation of the mitigation measures presented in Section 5.15.4 of the Revised AFC.

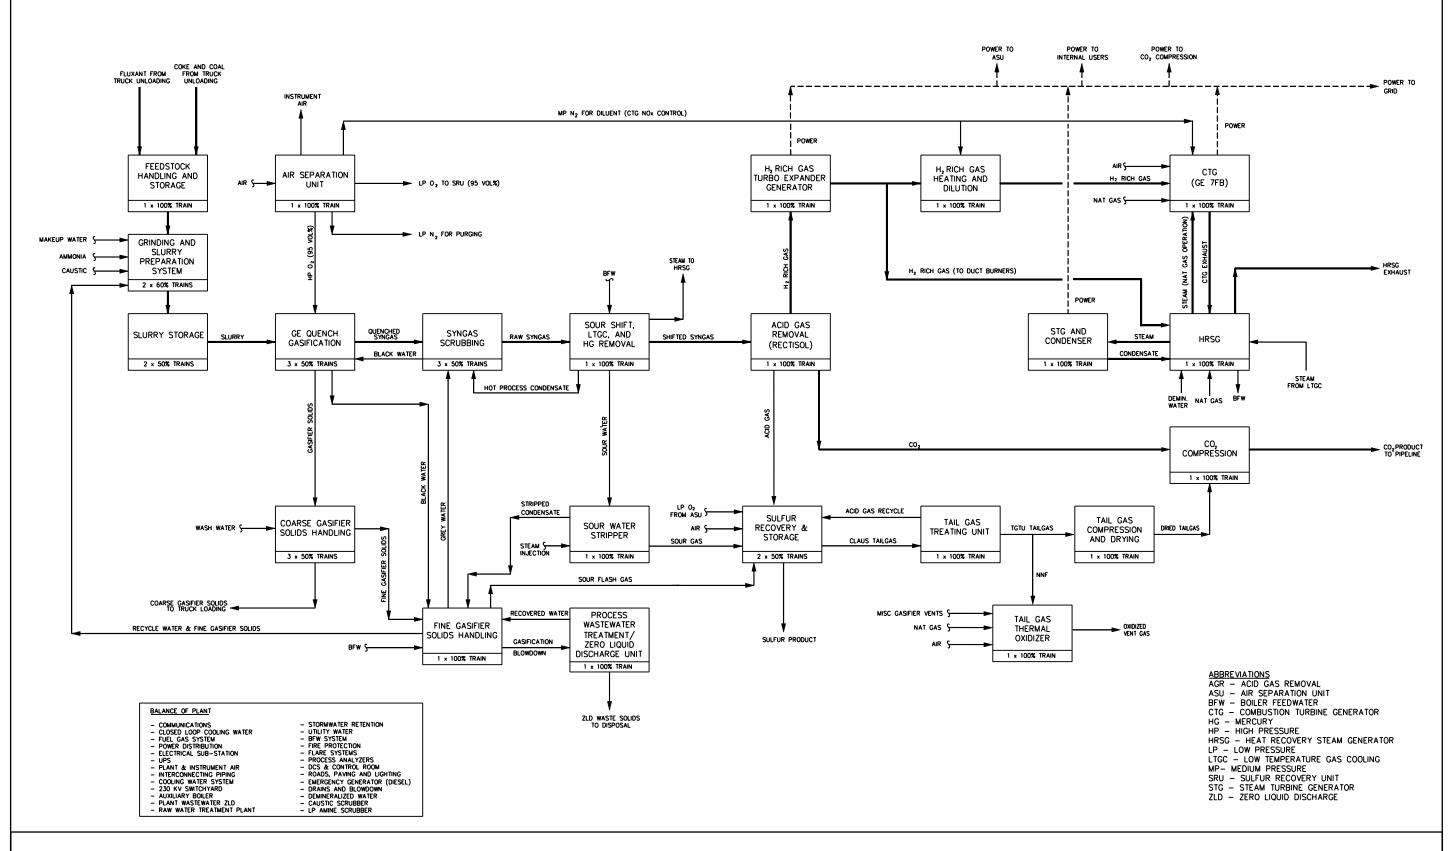

3.16 PALEONTOLOGICAL RESOURCES

The Project modification is within the 473-acre Project Site and would not result in disturbance of areas not previously evaluated in the Revised AFC. Therefore, the modification would not change the analysis of potential impacts to paleontological resources described in Section 5.16 of the Revised AFC for construction or operations, and impacts to paleontological resources are expected to remain less than significant with implementation of the mitigation measures identified in Section 5.16.4 of the Revised AFC.

REVISED PORTIONS OF APPENDIX C4 CALMET/CALPUFF AIR QUALITY MODELING RESULTS

The tables listed below have been revised to reflect the elimination of the GE LMS100 $^{\$}$ auxiliary combustion turbine generator (CTG) and the reduction of PM₁₀ and PM_{2.5} emission rates from the GE Frame 7B CTG/Heat Recovery System Generator (HRSG) when firing hydrogen-rich fuel. The remaining portions of Appendix C4 are unchanged.

Revised List of Tables

Maximum Emission Rates of Each Averaging Time Period
Source Location and Parameters
3-hour Averaged Emission Inventory for CALPUFF (3-hour SO ₂ Increment Analysis)
24-hour Averaged Emission Inventory for CALPUFF (24-hour NO_x , SO_2 , and PM_{10} Increment and Visibility Analyses)
Annual Averaged Emission Inventory for CALPUFF (Annual NO _x , SO ₂ , and PM ₁₀ Increment and Deposition Analyses)
PSD Class I Increment Significance Analysis – CALPUFF Results
Visibility Analysis – CALPUFF Results
Total Nitrogen and Sulfur Deposition Analysis – CALPUFF Results

Revised Table 2

Notes:

a The analysis also assumed that all emissions from two emergency generators are released to the emergency generator 1, which has worst dispersion characteristics.

b. Auxiliary boiler is not fired at the same time that the HRSG is operating.

c. There are three gasifiers. Only one gasifier warming will be operated at any one time. The emission is from GASVENTB, which results worst impact among three gasifiers.

Notes:

- (1) Minimum stack height assumed for worst-case dispersion.
- (2) Volume Flow Value shown in table for H2-rich fuel is based on full load syn gas combustion (relatively constant for varying ambient temperatures). Duct firing of the HSRG changes the stack volumetric flow by about 1% or less.
- (3) Full load stack flow for natural gas combustion will vary from the value shown in the table during warm summer ambient temperatures to about 18,000 act ft3/sec for winter ambient temperatures. Stack flow rates for co-firing of H2-rich gas and natural gas will range between the values shown for the two fuels separately.
- (4) Based on gasifier startup; stack parameters estimated from a previous project, to be confirmed by current flare suppliers.
- (5) Thirteen cells estimated for power block cooling tower; four cells estimated for process cooling tower, and four cells estimated for the ASU cooling tower.
- (6) Waste gas heat release, 10^6 Btu/hr, HHV. First exit flow value is normal pilot gas, the second value is the maximum startup heat release (Rectisol Flare has no planned operation than standby with pilot on)
- (7) Estimated oxidizer stack outlet flow for normal operating case of miscellaneous vent gas disposal; SRU startup case will be about 50% greater.

 $^{^{\}star\star}$ HRSG Stack Cofiring is estimated assuming 47% Syngas and the balance natural gas

- (1) HRSG modeling emission rates represents the maximum emissions rate from a composite firing scenario (all three fuels)
- (2) There are three separate cooling towers. The modeling rates are per cell.
- (3) There are two separate generators. Modeling rates are shown per individual generator.
- (4) There are three gasifiers. The modeling rate shown is per individual gasifier. However, only one gasifier warming will be operational at any one time.

(1) Total annual HRSG emissions represents the maximum emissions rate from a composite firing scenario (all three fuels)

⁽²⁾ Includes contributions from all three cooling towers

⁽³⁾ Includes contributions from both emergency generators

⁽⁴⁾ Feedstock emissions are shown as the contribution of all dust collection points.

⁽⁵⁾ Where PM10 = PM2.5, it is assumed that PM10 is 100% PM2.5

⁽⁶⁾ CO2e emission rates are shown as metric tons (tonnes)

All turbine operating parameters and emissions data provided by FLUOR based on expected operating parameters.

CTGs will always be started burning natural gas. Startup and shutdown emission rates above reflect natural gas.

Average annual normal operational emissions are calculated using yearly average- 65°F, at 100 % load. Duct burner emissions are calculated using yearly average- 65°F, at 100 % load with duct burners.

Startup and shutdown SO₂ emissions will always be lower than normal operation SO₂ emissions. Startup and shutdown emissions are assumed equal to normal operations (burning natural gas) at the max emission rate.

ssumptions

Quarterly normal operational emissions are calculated using yearly average- 65°F, at 100 % load.

Duct burner emissions are calculated using yearly average- 65°F, at 100 % load with duct burners.

Modeling Worst-Case 1 hr Emissions per Turbine

Pollutant	lb/hr/CT	g/sec/CT
NOx	167.0	21.0
co	1,679.7	211.6
SO ₂	7.4	0.93

Assumptions:

Startup emissions represent worst case hr for NOx and CO. Startup and shutdown only burn natural gas.

NOx emissions are from hot start

CO emissions are from cold start

Normal operation co firing represents worst case SO_{2.}

Calculation assumes that startup and shutdown SO₂ emissions will always be lower than normal operational (burning

natural gas) SO₂ emissions.

Gasification Flare - Operating Emissions During Gasifier Startup and Shutdown

Total Flare SU/SD Operation	115,500	MMBtu/yr
Wet Unshifted Gas Heat Rate	900	MMBtu/hr
Dry Shifted Gas Heat Rate	768	MMBtu/hr
Approximate Operating Hours (wet)	96	hr/yr
Approximate Operating Hours (dry)	38	hr/yr

Startup and shutdown flared gas scenario

 Cold plant startup =
 30,000 MMBtu/yr (1 event)
 (assume 20% unshifted)

 Plant shutdown =
 500 MMBtu/yr (1 event)
 (assume 100% unshifted)

 Gasifier outages =
 60,000 MMBtu/yr (24 events)
 (assume 100% unshifted)

 Gasifier hot restarts =
 25,000 MMBtu/yr (12 events)
 (assume 100% unshifted)

 Total
 115,500 MMBtu/yr
 (approx 75% unshifted)

SU/SD Flare Pollutant Emission Factors

NOx (lb/MMBtu, HHV)	0.07
CO (lb/MMBtu, HHV) (wet)	1.00
CO (lb/MMBtu, HHV) (dry)	0.37
VOC (lb/MMBtu, HHV)	0
SO ₂ (lb/MMBtu, HHV)	0
$PM_{10} = PM_{2.5} (Ib/MMBtu, HHV)$	0

SU/SD Flare Pollutant Emission Rates

	SU/SD Flare Emissions						
Pollutant	lb/hr (wet)	lb/hr (dry)	% Wet	% Dry	lb/hr (wet/dry)	ton/qtr (wet/dry)	ton/yr (wet/dry)
NOx	63.0	53.8	75.0%	25.0%	60.70	1.01	4.04
СО	900.0	284.3	75.0%	25.0%	746.08	12.16	48.65
VOC	0	0	0	0	0	0	0
SO ₂	0	0	0	0	0	0	0
$PM_{10} = PM_{2.5}$	0	0	0	0	0	0	0

Total emissions are determined based on the fractional amount of wet and dry gas burned.

Revised Appendix D1-2.xls 18 of 49

Hydrogen Energy, Inc
HECA Amendment
9/28/2009

Total Gasification Flare Emissions

		Emissions				
Pollutant	Pilot (ton/yr)	Pilot (ton/yr) SU/SD (ton/yr) Total (ton/qtr) Total (ton/yr				
NOx	0.26	4.04	1.08	4.3		
со	0.18	48.65	12.21	48.8		
voc	0.003	0.00	0.001	0.003		
SO ₂	0.004	0.00	0.001	0.004		
$PM_{10} = PM_{2.5}$	0.01	0.00	0.002	0.01		

Modeling Worst-Case 1 hr Emissions

NOx (g/sec)	7.9
CO (g/sec)	113.4
SO ₂ (g/sec)	0.0001

Only NOx, CO, and SO₂ are considered for an average 1-hour Ambient Air Quality Standard.

NOx and CO rates are taken from the SU/SD flaring events

SO₂ rate is from pilot operation

Modeling Worst-Case 3 hr Emissions

SO ₂ (lb/3-hr)	0.003
SO ₂ (g/sec)	0.0001

Only SO₂ is considered for an average 3-hour Ambient Air Quality Standard.

SO₂ pounds per 3-hr assumes three (3) hours of pilot operation.

Modeling Worst-Case 8 hr Emissions

CO (lb/8-hr)	7,200.00
CO (g/sec)	113.4

Only CO is considered for an average 8-hour Ambient Air Quality Standard.

Pounds per 8-hr assumes eight (8) hours of SU/SD flaring events.

Parameters

Days per year:	365
Hours per day:	24
Minutes per hour:	60
Seconds per minute:	60

Revised Appendix D1-2.xls 19 of 49

SRU Flare Emissions Summary

Hydrogen Energy, Inc
HECA Amendment
9/28/2009

Modeling Worst-Case 1 hr Emissions

NOx (g/sec)	0.544
CO (g/sec)	0.363
SO ₂ (g/sec)	2.19

Only NOx, CO, and SO2 are considered for an average 1-hour Ambient Air Quality Standard.

NOx, CO, and SO2 one (1) hr rates are from taken from the SU/SD flaring events

Modeling Worst-Case 3 hr Emissions

SO ₂ (lb/3-hr)	52.22
SO ₂ (g/sec)	2.19

Only SO₂ is considered for an average 3-hour Ambient Air Quality Standard.

Pounds per 3-hr assumes aproximately 3 hours (1 event) from SU/SD flaring.

Modeling Worst-Case 8 hr Emissions

CO (lb/8-hr)	8.76
CO (g/sec)	0.138

Only CO is considered for an average 8-hour Ambient Air Quality Standard.

Pounds per 8-hr assumes aproximately 3 hours (1 event) from SU/SD flaring and the remainder in pilot operation.

Modeling Worst-Case 24 Hour Emissions

mousting from our our and a finite fi	
SO ₂ (lb/24-hr)	52.23
SO ₂ (g/sec)	0.27
$PM_{10} = PM_{2.5} (lb/24-hr)$	0.34
$PM_{10} = PM_{2.5} (g/sec)$	0.0018

Only SO₂ and PM are considered for an average 24-hour Ambient Air Quality Standard.

SO₂ and PM pounds per 24-hr assume aproximately 3 hours (1 event) from SU/SD flaring and the remainder in pilot operation.

Tail Gas Thermal Oxidizer Emissions Summary

Hydrogen Energy, Inc

HECA Amendment

9/28/2009

Modeling Worst-Case 1 hr Emissions

NOx (g/sec)	0.6
CO (g/sec)	0.50
SO ₂ (g/sec)	0.25

Only NOx, CO, and SO₂ are considered for an average 1-hour Ambient Air Quality Standard.

NOx, CO, and SO₂ one (1) hr rates include contributions from both process venting and SRU startup.

Modeling Worst-Case 3 hr Emissions

SO ₂ (lb/3-hr)	6.06
SO ₂ (g/sec)	0.3

Only SO₂ is considered for an average 3-hour Ambient Air Quality Standard.

SO₂ pounds per 3-hr assumes three (3) hours of oxidation from both process venting and SRU startup.

Modeling Worst-Case 8 hr Emissions

CO (lb/8-hr)	32.00
CO (g/sec)	0.5

Only CO is considered for an average 8-hour Ambient Air Quality Standard.

Pounds per 8-hr assumes eight (8) hours of oxidation from both process venting and SRU startup.

Modeling Worst-Case 24 Hour Emissions

SO ₂ (lb/24-hr)	48.49
SO ₂ (g/sec)	0.3
$PM_{10} = PM_{2.5} (lb/24-hr)$	3.84
$PM_{10} = PM_{2.5} (g/sec)$	0.02

Only SO₂ and PM are considered for an average 24-hour Ambient Air Quality Standard.

Pounds per 24-hr assumes 24 hours of oxidation from both process venting and SRU startup.

Modeling Annual Average Emissions

modeling / minden / troings = modeling	
NOx (g/sec)	0.3
CO (g/sec)	0.26
VOC (g/sec)	0.01
SO ₂ (g/sec)	0.3
$PM_{10} = PM_{2.5} (g/sec)$	0.01

Pounds per year assumes all contributions from annual waste gas oxidation and periodic SRU startup.

$PM_{10} = PM_{2.5} (g/sec)$	0.0037

Pounds per year assumes 1,800 hours of annual normal operation.

Revised Appendix D1-2.xls 32 of 49

Cooling Towers Emissions Summary

Hydrogen Energy, Inc
HECA Amendment
9/28/2009

Cooling Towers - Annual Operating Emissions

			_				
Total Hours of Operation	8,322	hr/yr		Hours per Qtr			
			-	Q1	Q2	Q3	Q4
				2080.5	2080 5	2080.5	2080 5

Assuming equal operation in each quarter

Cooling Tower Operating Parameters

	Power Block	Process Area	ASU	Basis
Cooling water (CW) circulation rate, gpm	175,000	42,300	40,200	Typical plant performance
CW circulation rate (million lb/hr)	88	21	20	
CW dissolved solids (ppmw)	9,000	9,000	9,000	(See note)
Drift, fraction of circulating CW	0.0005%	0.0005%	0.0005%	Expected BACT

Note: Assumed 9,000 ppm TDS in circulating cooling water. Circulating water could range from 1200 to 90,000 ppm TDS depending on makeup water quality and tower operation. PM10 emissions would vary proportionately.

Cooling Tower PM₁₀ Emissions

	Cooling Tower PM ₁₀ Emissions Ib/hr				
Power Block Cooling Tower PM 10 Emissions	3.94	94.50	32,767.88	4.10	16.38
Process Area Cooling Tower PM ₁₀ Emissions	0.95	22.84	7,920.46	0.99	3.96
ASU Cooling Tower PM ₁₀ Emissions	0.90	21.71	7,527.25	0.94	3.76

Revised Appendix D1-2.xls 33 of 49

Cooling Towers Emissions Summary

Hydrogen Energy, Inc
HECA Amendment

Total Cooling Tower PM₁₀ Emissions

	(ton/yr)
PM ₁₀	24.11
PM _{2.5}	14.46

PM_{2.5} emission factors were determined by multiplying PM₁₀ numbers by a "PM_{2.5} fraction of PM₁₀" value. Fractional values for PM_{2.5} were taken from the SCAQMD guidance: Final - Methodology to Calculate PM_{2.5} and PM_{2.5} Significance Thresholds, October 2006: Appendix A - Updated CEIDARS Table with PM_{2.5} Fractions.

Modeling Worst-Case 24 Hour Emissions	Power Block	Process Area	ASU
Cells per Cooling Tower	13	4	4
PM ₁₀ (lb/24-hr)	94.50	22.84	21.71
PM ₁₀ (g/sec/cell)	0.038	0.030	0.028
PM _{2.5} (lb/24-hr)	56.70	13.71	13.02
PM _{2.5} (g/sec/cell)	0.023	0.018	0.017

PM is considered for an average 24-hour Ambient Air Quality Standard.

Pounds per 24-hr assumes 24 hours of continual operation.

Modeling Worst-Case Annual Emissions	Power Block	Process Area	ASU
Cells per Cooling Tower	13	4	4
PM ₁₀ (ton/yr)	16.38	3.96	3.76
PM ₁₀ (g/sec/cell)	0.036	0.028	0.027
PM _{2.5} (lb/24-hr)	9.830	2.376	2.258
PM _{2.5} (g/sec/cell)	0.022	0.017	0.016

PM is considered for an annual average Ambient Air Quality Standard.

Assumes continual annual operation.

Intermittent CO₂ Vent Emissions Summary

Hydrogen Energy, Inc HECA Amendment 9/28/2009

Modeling Worst-Case 1 hr Emissions

CO (g/sec)	53.4
H ₂ S (g/sec)	0.6

Only H_2S and CO are considered for an average 1-hour Ambient Air Quality Standard. H_2S and CO one (1) hr rates assume normal venting operation.

Modeling Worst-Case 8 hr Emissions

CO (lb/8-hr)	3,393.63
CO (g/sec)	53.4

Only CO is considered for an average 8-hour Ambient Air Quality Standard. Pounds per 8-hr assumes eight (8) continuous hours of venting.

Modeling Annual Average Emissions

со	3.1
VOC	0.1
H2S	0.0

Pounds per year assumes normal venting averaged over the entire year.

Parameters

Days per year:	365

GHG Emissions Summary by Source

Emissions Summary

Hydrogen Energy, Inc HECA Amendment 9/28/2009

GHG emissions are numerically depicted as metric tons (tonne) of carbon dioxide equivalents (CO₂e). CO₂e represents CO₂ plus the additional warming potential from CH₄ and N₂O. CH₄ and N₂O have 21 and 310 times the warming potential of CO₂, respectively.

Natural Gas GHG Emission Factors

Diesel GHG Emission Factors

CO ₂ =	52.78	kg/MMBtu =	116.36	lb/MMBtu	CO ₂ =	10.15	kg/gal =	22.38	lb/gal
CH ₄ =	0.0059	kg/MMBtu =	0.013	lb/MMBtu	CH ₄ =	0.0003	kg/gal =	0.001	lb/gal
$N_2O =$	0.0001	kg/MMBtu =	0.00022	lb/MMBtu	$N_2O =$	0.0001	kg/gal =	0.0002	lb/gal

CO₂, CH₄, and N₂O emission factors are taken from Appendix C of the California Climate Action Registry (CCAR) General Reporting Protocol Version 2.2 (March 2007)

HRSG Stack

$N_2O =$	0.01	tonne/yr =	3	tonne CO ₂ e/yr	Total tonne CO ₂ e/yr =	5,290

During mature operation of the HRSG, the unit will fire only syngas, except during periods of startup and shutdown.

Startup and shutdown of the HRSG will be accomplished using natural gas. The total startup and shutdown operating hours are estimated at 50 hr/yr.

HRSG heat input rate is assumed to be the maximum heat input rate firing natural gas, which corresponds to winter minimum (20 F).

HRSG Stack - Burning Hydrogen-Rich Fuel
